1. How long does it take a packet of length 15,000 bytes to propagate over a link of distance 1,200 km, propagation speed 3×10^8 m/s, and transmission rate 2 Mbps? More generally, how long does it take a packet of length L to propagate over a link of distance d , propagation speed s , and transmission rate R bps? Does this delay depend on packet length? Does this delay depend on the transmission rate?

Ans.

$$L = 15000 \text{ bytes} \times 8 = 120,000 \text{ bits}$$

$$R = 2 \text{ Mbps} \times 1 \times 10^6 = 2 \times 10^6 \text{ bps}$$

$$\text{Transmission delay: } \frac{L}{R} = \frac{120,000 \text{ bits}}{2 \times 10^6 \text{ bps}} = 0.06 \text{ sec}$$

$$0.06 \text{ sec} \times 1000 = 60 \text{ ms}$$

$$d = 1200 \text{ km}$$

$$s = \frac{3 \times 10^8 \text{ m/s}}{1000} = 3 \times 10^5 \text{ km/s}$$

$$\text{Propagation delay: } \frac{d}{s} = \frac{1200 \text{ km}}{3 \times 10^5 \text{ km/s}} = 4 \times 10^{-3} \text{ sec}$$

$$4 \times 10^{-3} \text{ sec} \times 1000 = 4 \text{ ms}$$

$$\text{Total delay: } d_{\text{trans}} + d_{\text{prop}} = 4 \text{ ms} + 60 \text{ ms} = 64 \text{ ms}$$

Therefore, the total delay depends on the packet length and the transmission rate. The total delay is the sum of the propagation and transmission delays. The propagation delay does not depend on the packet length or the transmission rate, but the transmission delay does. Therefore, the longer the packet or the lower the transmission rate, the higher the transmission delay and the total delay.

Q. Consider the figure below, with three links, each with the specified transmission rate and link length.

Find the end-to-end delay (including the transmission delays and propagation delays on each of the three links, but ignoring queueing delays and processing delays) from when the left host begins transmitting the first bit of a packet to the time when the last bit of that packet is received at the server at the right. The speed of light propagation delay on each link is 2.5×10^8 m/sec. Note that the transmission rates are in Mbps and the link distances are in Km. Assume a packet length of 12,000 bits. Give your answer in milliseconds.

Ans:

$$s = \frac{2.5 \times 10^8 \text{ m/s}}{1000} = 250000 \text{ km/s}$$

$$L = 12000 \text{ bits}$$

Link1:

$$R = 10 \text{ Mbps} \times 1 \times 10^6 = 1 \times 10^7 \text{ bps}$$

$$d_{\text{trans}}: \frac{L}{R} = \frac{12000 \text{ bits}}{1 \times 10^7 \text{ bps}} = 1.2 \times 10^{-3} \text{ sec} = 1.2 \text{ ms}$$

$$d_{\text{prop}}: \frac{d}{s} = \frac{2 \text{ km}}{250000 \text{ km/s}} = 8 \times 10^{-6} \text{ sec} = 8 \times 10^{-3} \text{ ms}$$

Link2:

$$R = 1 \text{ Mbps} \times 1 \times 10^6 = 1 \times 10^6 \text{ bps}$$

$$d_{\text{trans}}: \frac{L}{R} = \frac{12000 \text{ bits}}{1 \times 10^6 \text{ bps}} = 0.012 \text{ sec} = 12 \text{ ms}$$

$$d_{\text{prop}}: \frac{d}{s} = \frac{500 \text{ km}}{250000 \text{ km/s}} = 2 \times 10^{-3} \text{ sec} = 2 \text{ ms}$$

Link3:

$$R = 100 \text{ Mbps} \times 1 \times 10^6 = 1 \times 10^8 \text{ bps}$$

$$d_{\text{trans}}: \frac{L}{R} = \frac{12000 \text{ bits}}{1 \times 10^8 \text{ bps}} = 1.2 \times 10^{-4} \text{ sec} = 0.12 \text{ ms}$$

$$d_{\text{prop}}: \frac{d}{s} = \frac{1 \text{ km}}{250000 \text{ km/s}} = 4 \times 10^{-6} \text{ sec} = 4 \times 10^{-3} \text{ ms}$$

End-to-end delay including transmission delays and propagation delays on each of the three links

$$= 1.2 + 8 \times 10^{-3} + 12 + 2 + 0.12 + 4 \times 10^{-3} = 15.332 \text{ ms}$$
